2

Blueberry leaves in the top and side of the plant receive maximum sunlight

Light interception changes because of canopy shape

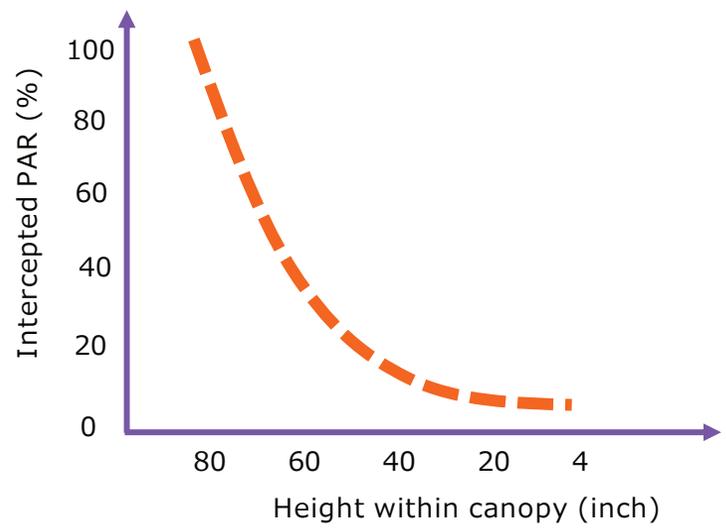

Top

Inside

Side

But not all leaves have the same exposure to light.

3

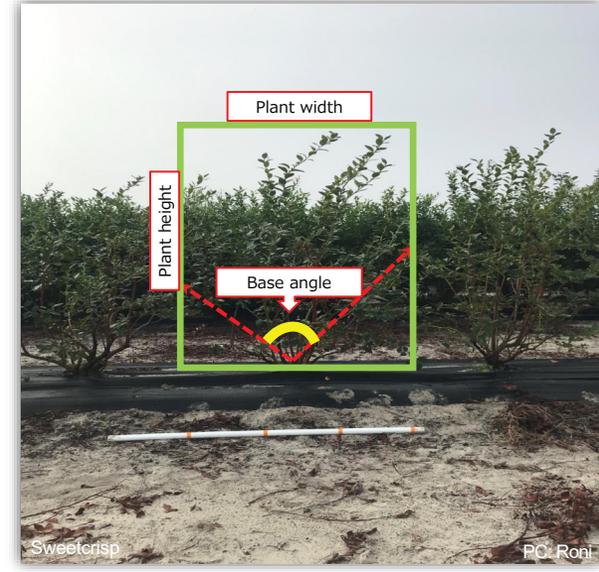

4

We investigated how plant shape affects canopy photosynthetic light interception

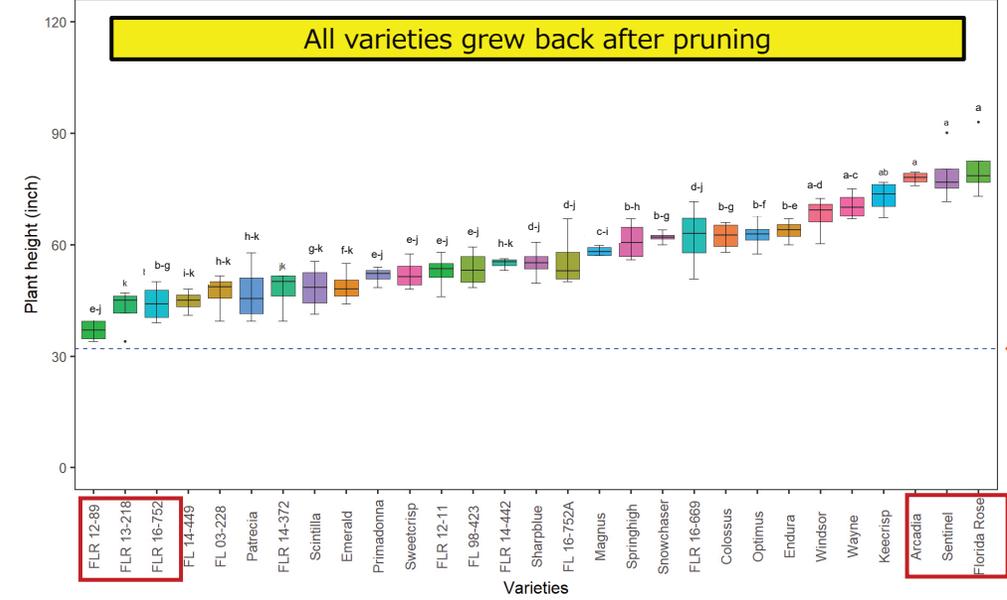

Plant materials

- 29 southern highbush blueberry (SHB) genotypes
- Plant age: 5 years old
- Hedging: weeks 18-20
- PSREU, Citra

We found great diversity in plant height

Pruning height ~32-36 inches

Taller plants receive less light in the bottom the canopy than shorter plants

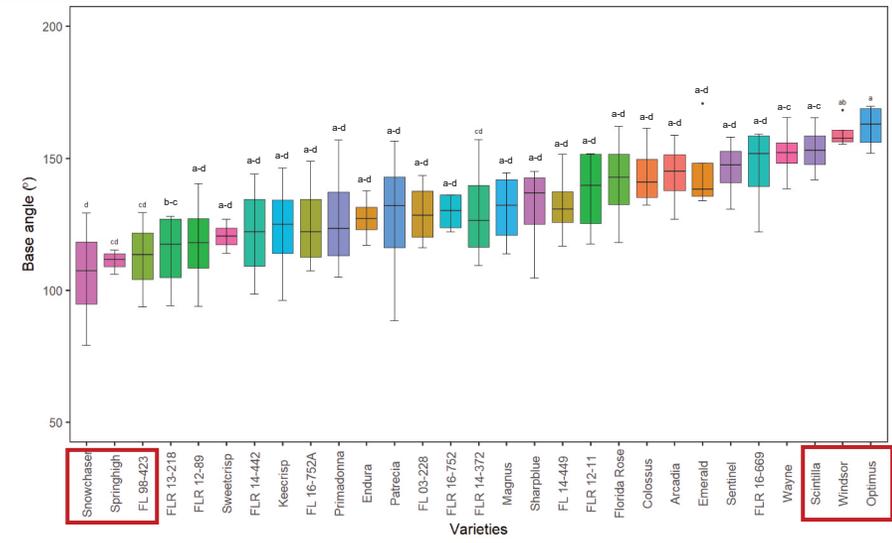

Arcadia

FLR 12-89

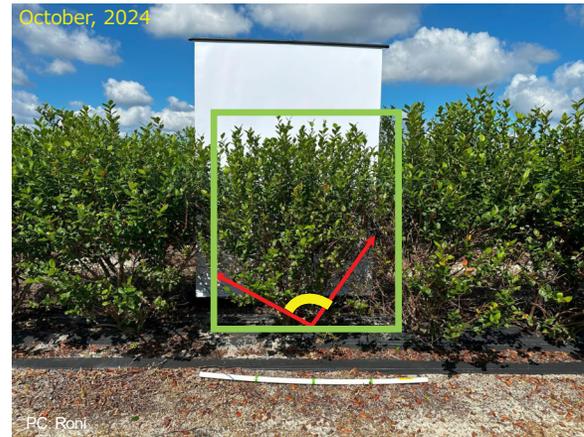

We found great diversity in plant base angle

We found expansive and columnar varieties

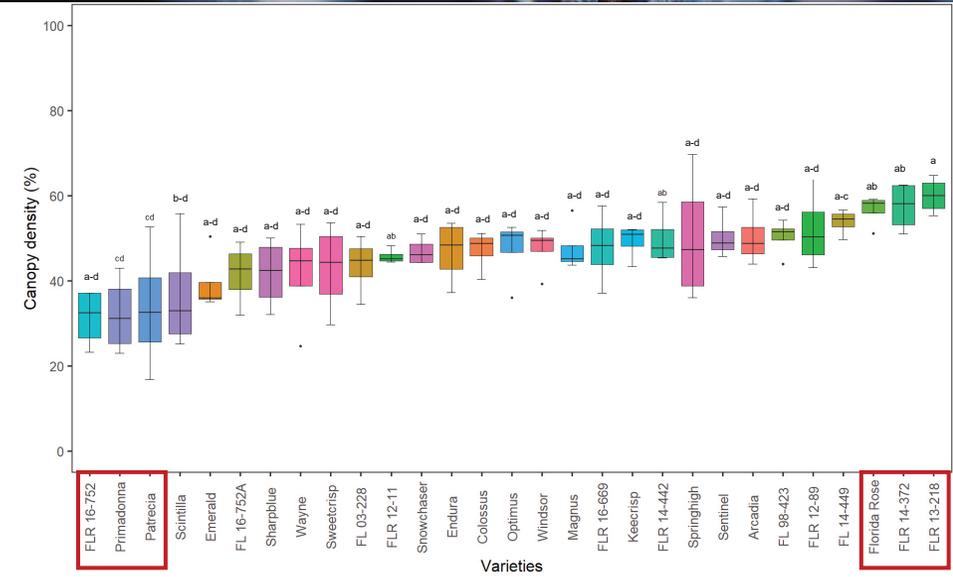

Windsor

Snowchaser

9

We found great diversity in canopy density

10

We found dense and sparse canopies

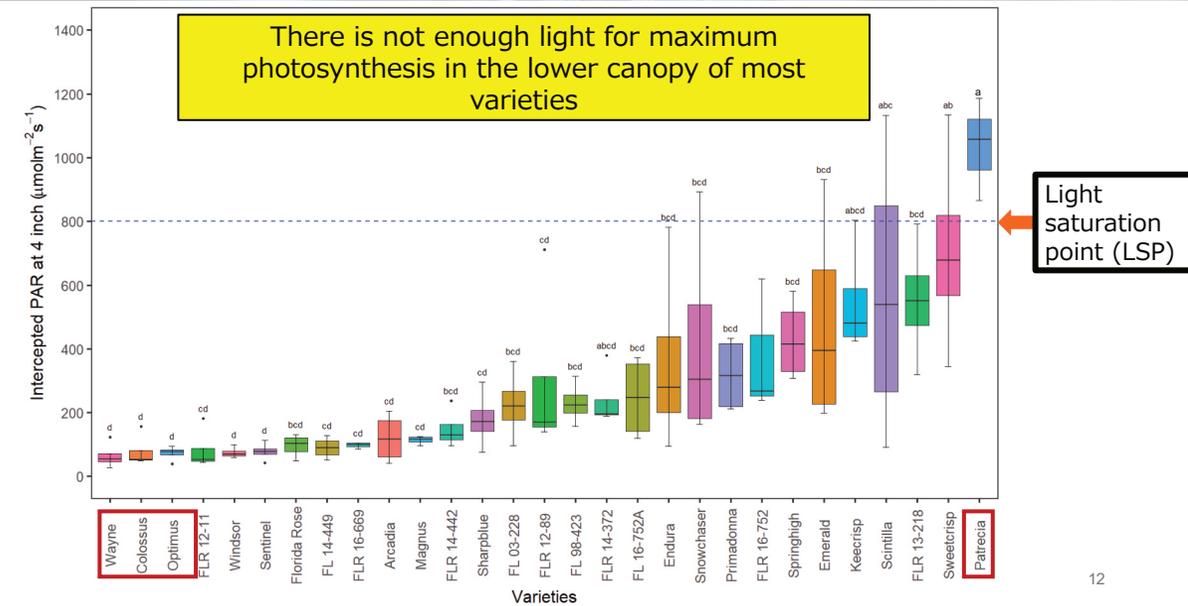

FLR 14-372

Primadonna

11

Canopy shape impacts intercepted PAR

12

Taller plants receive less light in the bottom the canopy than shorter plants

Light interception depends on canopy shape and cultivars

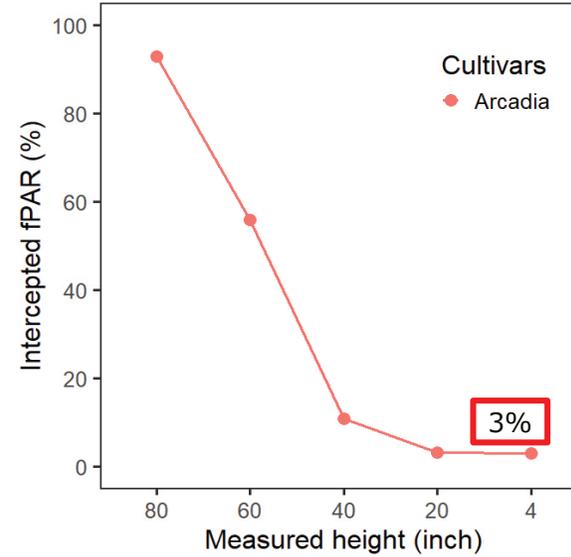

Arcadia

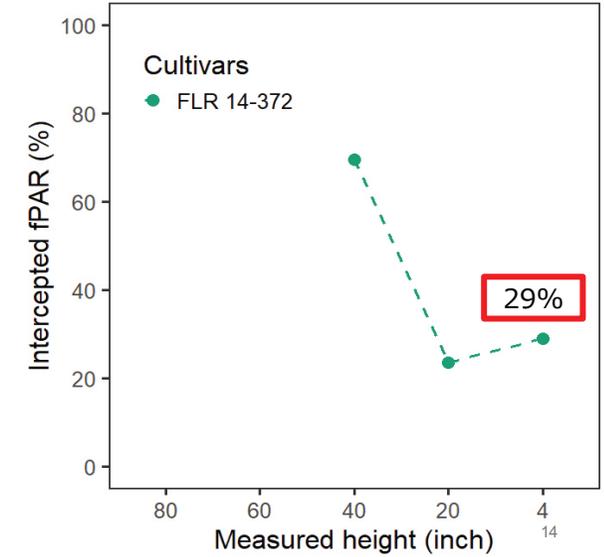

FLR 14-372

13

Tallest plant

Shortest plant

14

Wide plants receive less light in the bottom the canopy than narrow plants

Light interception depends on canopy shape and cultivars

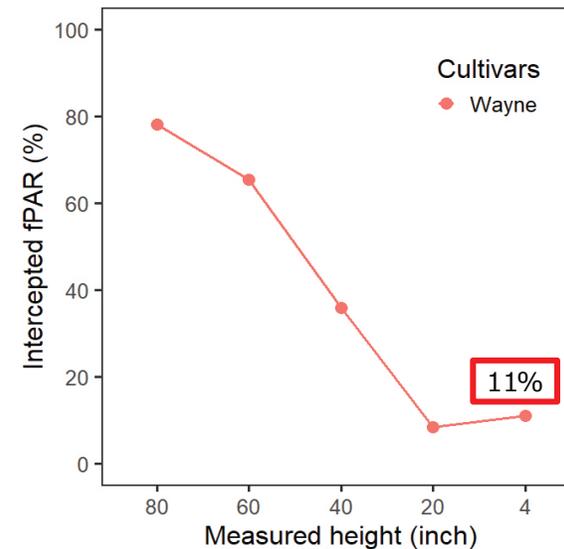

Wayne

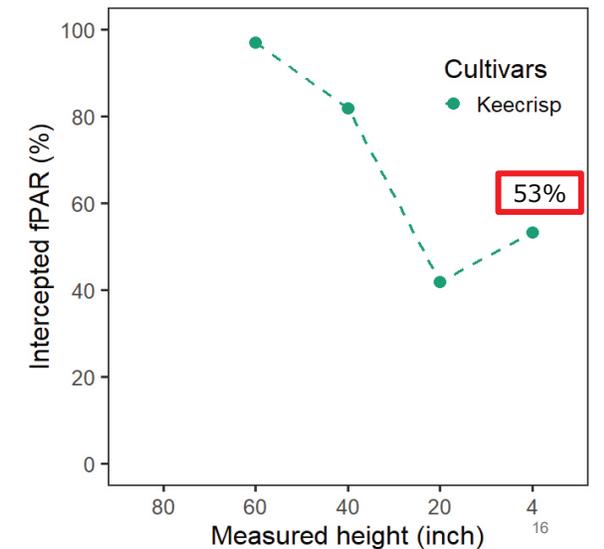

Sweetcrisp

15

Widest Plant

Narrowest Plant

16

Plants with dense canopies receive less light in the bottom of the canopy than plants with sparse canopies

Light interception depends on canopy shape and cultivars

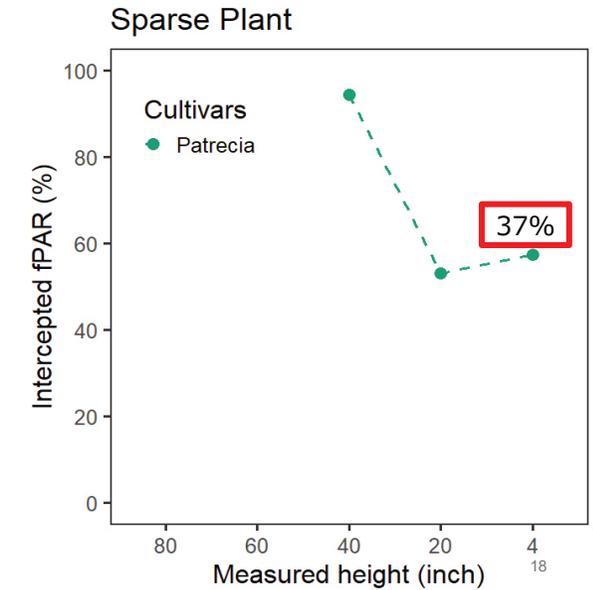

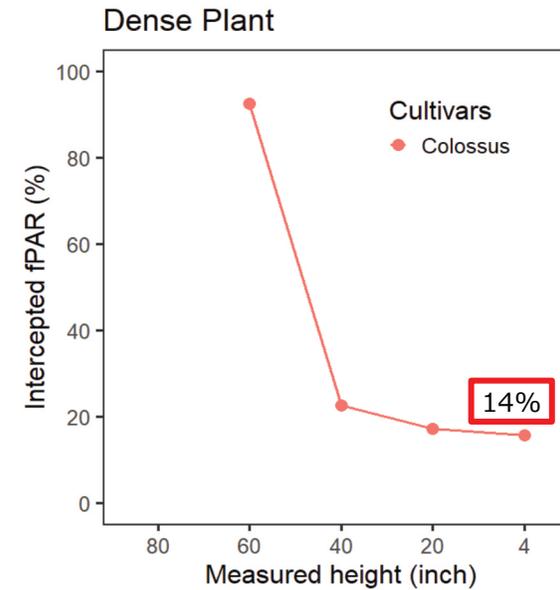

Colossus

Patrecia

17

18

Summary

- Light interception changes throughout the blueberry canopy.
- There are different canopy shapes in southern highbush blueberry.
- Canopy shape impacts photosynthetic light interception.
